## Terms & Tools to Know

TCP vs UDP

QoS (Quality of Service)

Dante Flows

Unicast, Broadcast & Multicast

IGMP Snooping

## Dante's Word Clock

Review: Digital Audio

Review: Clocking Architecture

Real Scope Views of Clocks

Application: Why does it matter?

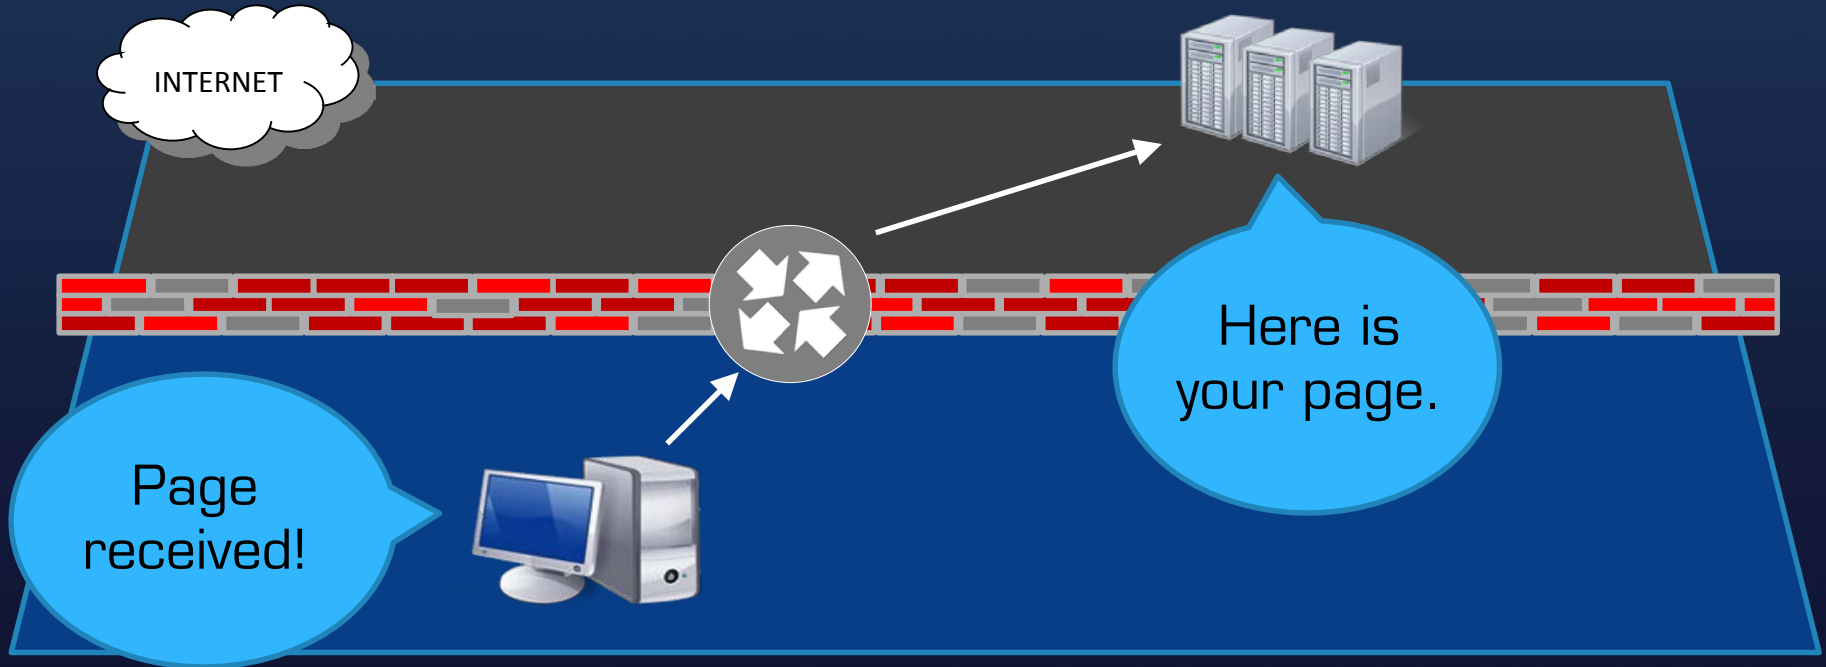

# TCP vs. UDP

- TCP is akin to “Signature Required” delivery
  - System can slow down or retry a message
  - Configuration is received by sender
  - Typical for web browsing, email, “telnet” control
- UDP is more like “First Class Mail”
  - Sender trusts delivery occurs – no tracking/retries.
  - Streamlines delivery, reduces overhead.
  - Typical for time-sensitive content (streaming)

# TCP Traffic

# TCP Traffic

# UDP Traffic

Traffic can occur both ways.  
Data does not have to be verified.

# QoS (Quality of Service)

Prioritizing Time-Sensitive Traffic

- Large deliveries are broken in to pieces, shipped, reassembled.
- Packet types can be prioritized.

# QoS (Quality of Service)

Prioritizing Time-Sensitive Traffic

# Unicast Distribution

## 1:1

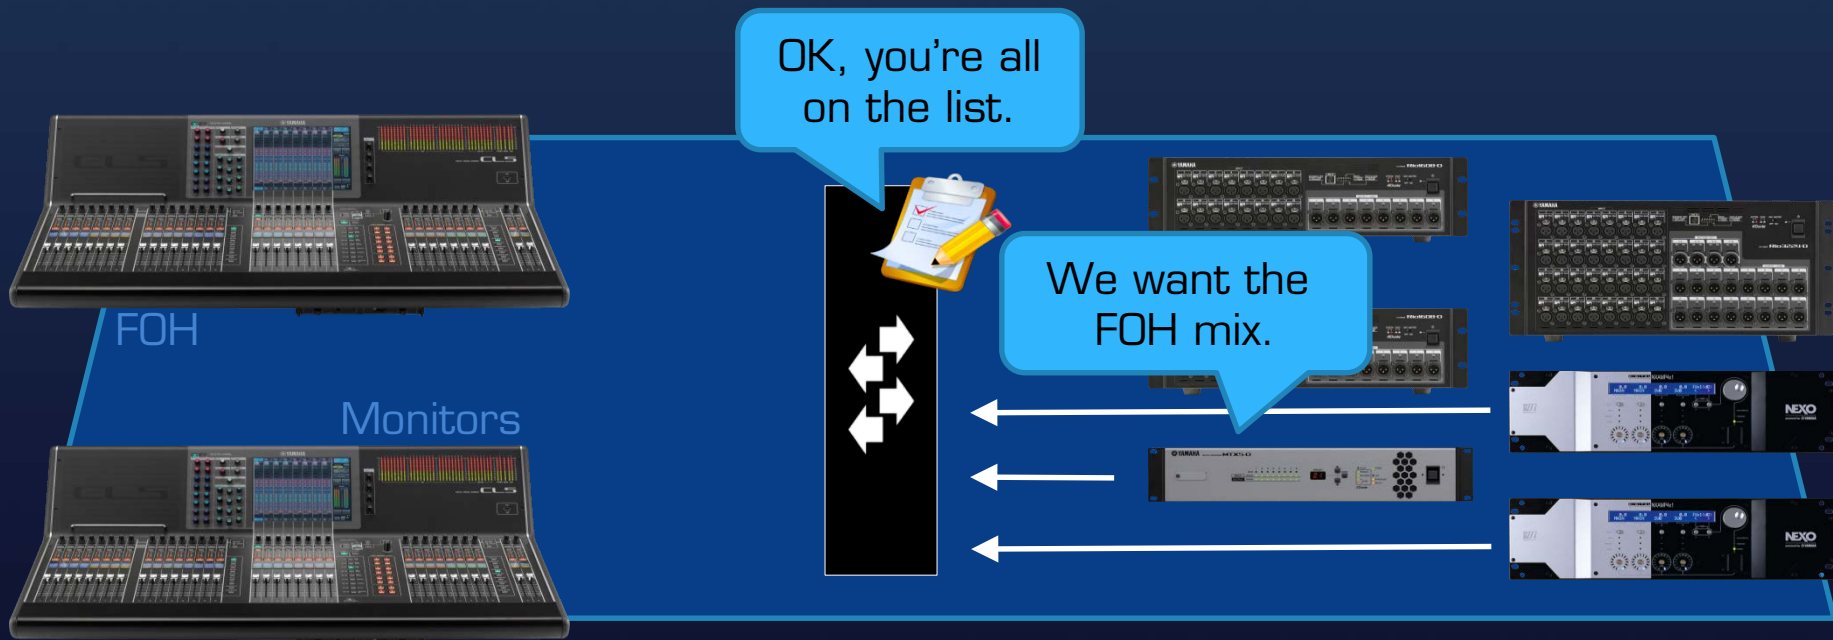

# Broadcast Distribution

## 1:All

# Multicast Distribution

## 1: Select List

# Multicast Distribution

## 1:Select List

# Multicast Distribution

## 1:Select List

- IGMP Snooping gives Multicast its advantage
- No IGMP Snooping Turns Multicast to Broadcast
- IGMP Snooping is more processor intensive in switch.

# Guesstimating Network Bandwidth

Initial Assumptions:

---

- 1) Port speed  $\geq 1$  Gbit
  - 2) Switch backbone is 2x Port Speed
- 

20 ports x 1 Gbit x 2 = 40 Gbit backbone

# Guesstimating Network Bandwidth

- Raw capacity within a network switch is OK.
- Only examine uplinks between switches.
  - $\leq 320$  channels in each direction (per 1 Gbit)
- Using Multicast? Watch CPU load in switch.

# Dante Word Clock

But first, a *quick* introduction to  
Digital Audio & Word Clock

# Perspective from Knott's Berry Farm

# Why Do We Cover Digital Audio Basics?

While getting trained for a new show...

# Why Do We Cover Digital Audio Basics?

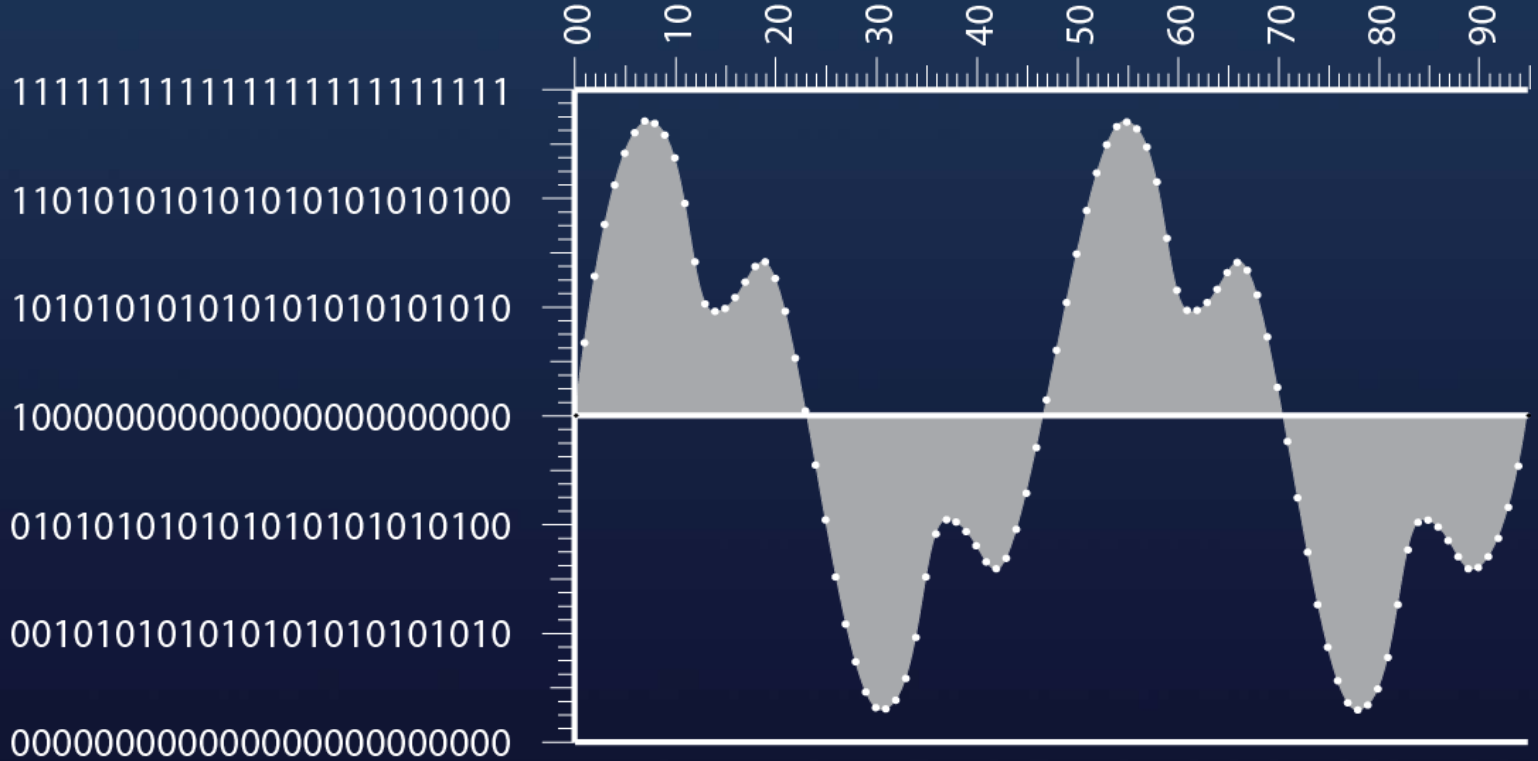

What is a sample rate?

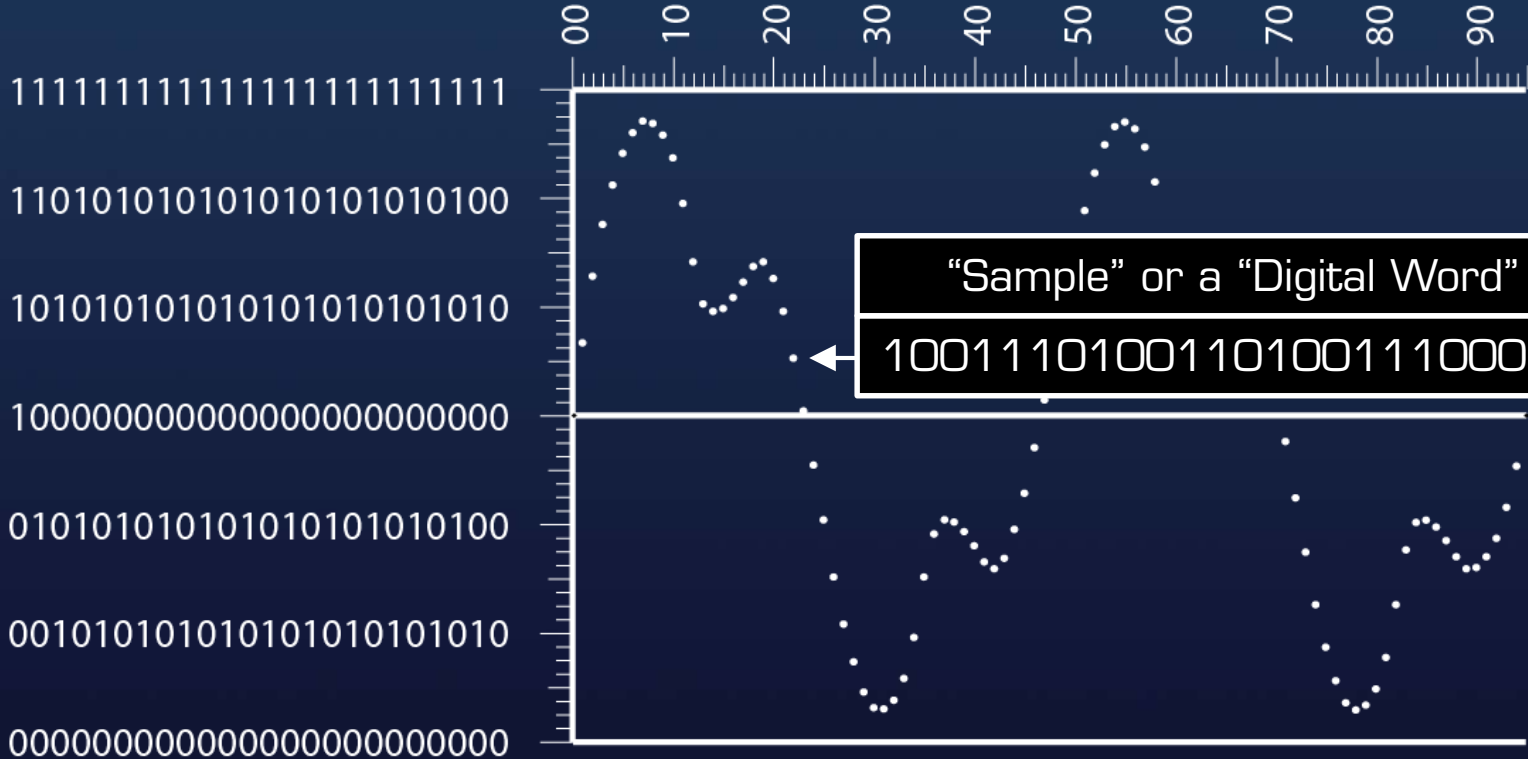

# What is Sample Rate?

Time

# Time

## Sample Rate

*X-Axis Resolution*

*Num of Samples/Sec?*

44.1kHz (44,100/sec)

48kHz (48,000/sec)

88.2kHz (88,200/sec)

96kHz (96,000/sec)

## Sample Rate

## Bit Depth / Word Length

*X-Axis Resolution*

*Y-Axis Resolution*

*Num of Samples/Sec?*

*Accuracy of Each Sample?*

44.1kHz (44,100/sec)

16-bit

48kHz (48,000/sec)

20-bit

88.2kHz (88,200/sec)

24-bit

96kHz (96,000/sec)

32-bit

# Why Do We Cover Digital Audio Basics?

Talking to an engineer  
fresh off a tour ...

# Why Do We Cover Digital Audio Basics?

I enjoy working with the M7CL and PM5D. They are great analog consoles.

# Why Do We Cover Digital Audio Basics?

means your whole system is connected digitally.

represents the first time many will connect digitally.

Chase clock at digital input.

Word Clock Variance (Propagation Delay)

Word Clock Variance (Propagation Delay)

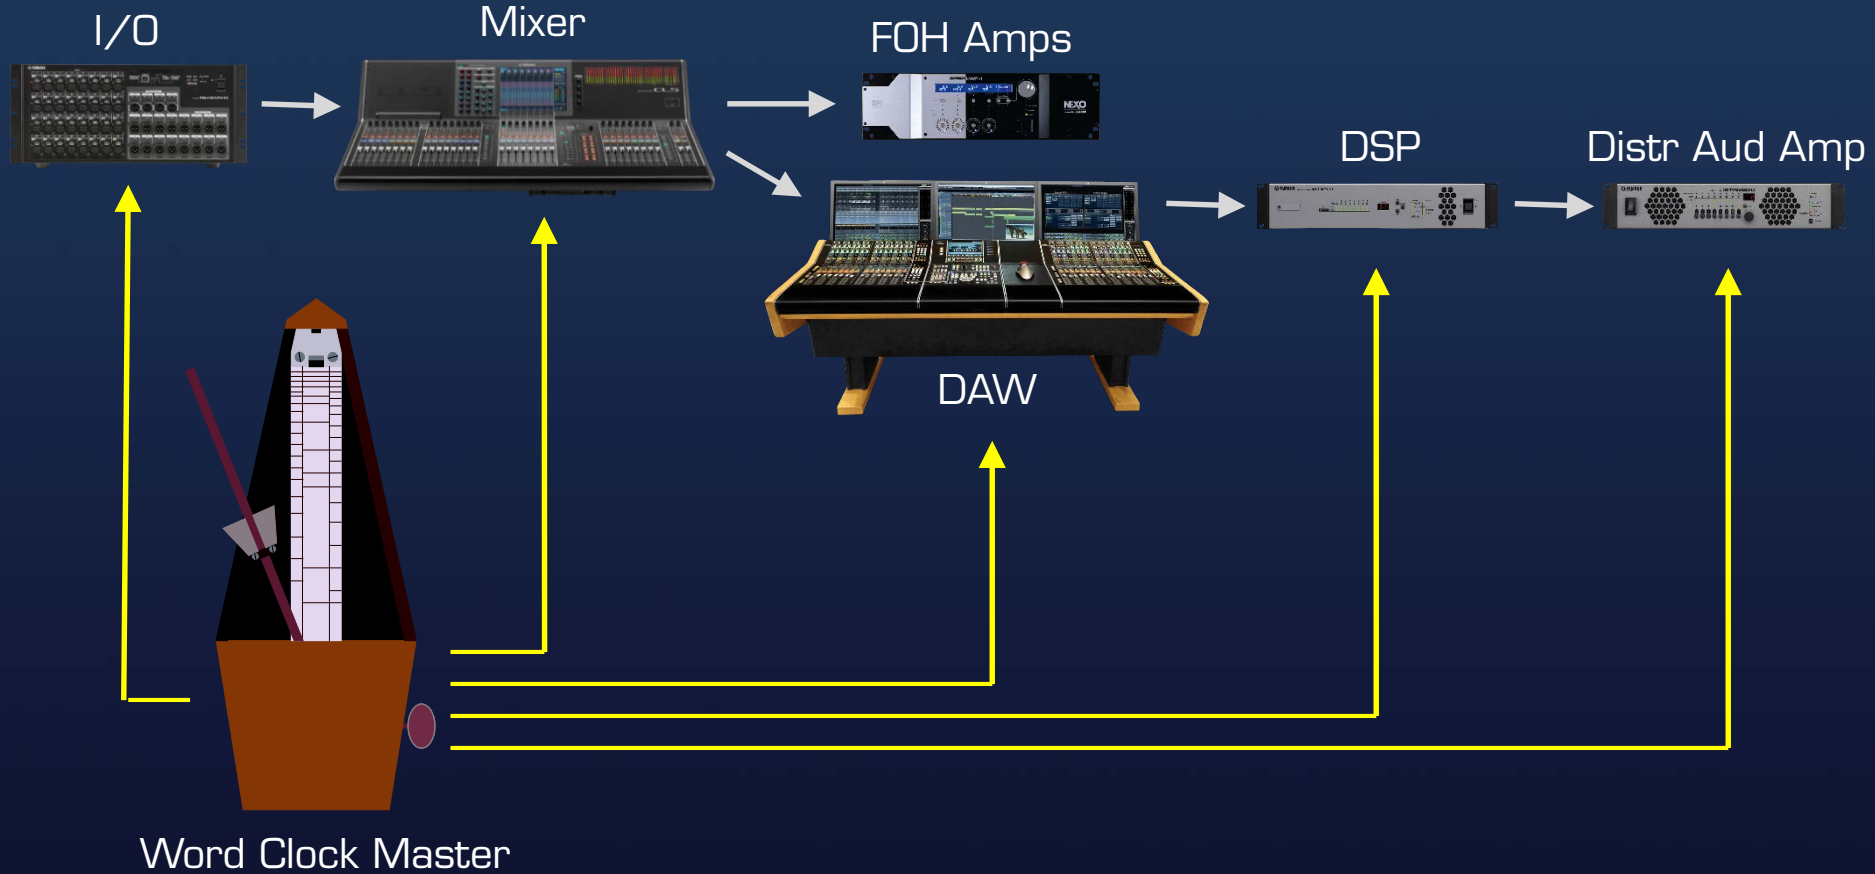

Word Clock Variance (Propagation Delay)

# Why Do We Cover Digital Audio Basics?

“Is Word Clock  
like SMPTE?”

SMPTE is a positional  
(timeline) reference.

Word Clock is a  
cyclical reference.

# Time Code and Word Clock Need to be “Resolved”

## Clock Master Election:

- (1) Preferred Master Your Choice
- (2) Chasing External Clock Automatic
- (3) Best Clock
- (4) Lowest MAC Address

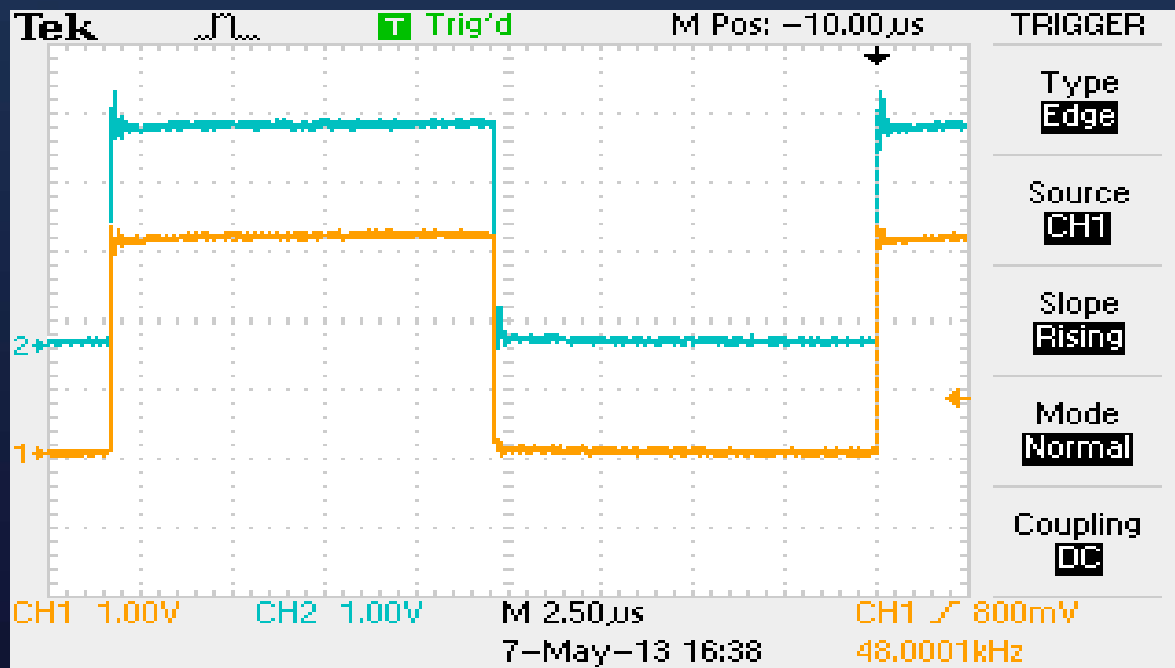

# Word Clock Precision

- Digital Audio often uses Time Division Multiplexing (TDM)
  - TDM is typical for AES/EBU, MADI, CobraNet, EtherSound, etc.
  - Audio is sent in time, clock is derived from timing.
  - Each link down the chain is slightly later than its predecessor.
- Dante uses Precision Time Protocol (PTP)
  - IEEE1588, sub microsecond accuracy.
  - Sync packets are separate from audio packets.
  - Devices calculate delay in network transmission.
  - In Sync & In Phase
